```
The present sequence represents a Staphylococcus aureus protein, that, based on homology with a Bacillus subtilis protein, is believed to be a probable UDP-N-acetylglucosamine 1-carboxyvinyltransferase (enoylpyruvate transferase, UDP-N-acetylglucosamine enoylpyruvyl transferase). The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of staphylococcal genes. The DNA sequence to control the expression of staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host appaint invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome
                                                                        Staphylococcus aureus protein, ribozyme; antisense sequence; control; Staphylococcal gene; regulatory element; bacterial gene expression; vaccine; Staphylococcal infection; food poisoning; scaled skin syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 - us
isolate antimicrobial compounds, and in vaccines against S. aureus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the invention relates to an increte act completely any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(i) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated nutisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway cequired for that has an activity against a biological pathway cequired for that has an activity against a biological pathway in which a proliferation or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sactivity; (11) a culture comprising strains in which the estent compound that inhibits the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the control of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation of an organism. The antisense modeled are useful for dence of the control of the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention relates to an isolated nucleic acid comprising any one of

This represents a receptor protein tyrosine kinase (PTK) subtype tyro-9.

The invention provides sequences AAV65308 to AAV65313, AAV65315, and
AAV65317 to AAV65319 that encode proteins having a tyrosine kinase domain
and a tissue expression pattern of a receptor PTK subtype selected from
and a tissue expression pattern of a receptor PTK subtype selected from
tyro-1, tyro-2, tyro-3, tyro-4, tyro-5, tyro-6, tyro-8, tyro-10, tyro-11,
and tyro-12, respectively. The polymaclecides are useful for the
certion of tyrosine kinase domain sequences and detection of tissue
certion patterns of PTK subtypes. The cDNAs can also be injected into
cocytes, the protein expressed, and expression products screened for
using antibodies against tyrosine kinase epitopes. These subtypes
cocytes, the protein expressed, and expression products screened for
using antibodies against tyrosine kinase epitopes. These
certion protocols are used in the diagnosis of diseases associated with
(receptor) PTKS. Recombinant vectors expressing the subtypes can be used
to treat related diseases e.g. tumours, by introduction of the vectors
into skin transplants, then grafting these into the connective tissue of
the dermis, thus specifically targetting tumours as the proteins are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a substantially pure protein(s) or their fragments, comprising a tyrosine kinase domain and a tissue expression pattern having at least one receptor protein-tyrosine kinase subtype. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel pure protein-tyrosine kinase receptor subtypes useful in assays to screen various compositions which modulate these receptors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This represents a novel receptor protein tyrosine kinase (PTK) polypeptide subtype tyro-9. The invention provides polynucleotide sequences encoding novel PTK polypeptide subtypes tyro-1 to tyro-13. The PTK subtypes are found expressed predominantly in the brain tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                            Receptor protein tyrosine kinase polypeptide, tyro-3 - preferably expressed in brain tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a substantially pure protein(s) or their fragments, comprising a tyrosine kinase domain and a tissue expression pattern having at least one receptor protein-tyrosine kinase subtype. The protein(s) comprises a tyrosine kinase domain and a tissue expression pattern having at least one receptor protein-tyrosine kinase subtype selected from tyro-1, tyro-2, tyro-4, tyro-5, tyro-6, tyro-7, tyro-8, tyro-10, tyro-11 and tyro-12. The protein is useful in assays to screen various compositions which modulate these protein-tyrosine kinase receptors. The presents sequence represents the amino acid sequence of a receptor protein tyrosine kinase tyro subtype
      pattern having at least one receptor protein-tyrosine kinase subtype selected from tyro-1, tyro-2, tyro-4, tyro-5, tyro-6, tyro-7, tyro-8, tyro-10, tyro-11 and tyro- 12. The protein is useful in assays to screen various compositions which modulate these protein-tyrosine kinase receptors. The presents sequence represents the amino acid sequence of a receptor protein tyrosine kinase domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel pure protein-tyrosine kinase receptor subtypes useful in assays to screen various compositions which modulate these receptors.
protein(s) comprises a tyrosine kinase domain and a tissue expression

The protein(s) comprises a tyrosine kinase domain and a tissue expression pattern having at least one receptor protein-tyrosine kinase subtype selected from tyro-1, tyro-2, tyro-4, tyro-5, tyro-6, tyro-7, tyro-8, tyro-10, tyro-11 and tyro-12. The protein is useful in assays to screen various compositions which modulate these protein-tyrosine kinase receptors. The presents sequence represents the amino acid sequence of a receptor protein tyrosine kinase domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel pure protein-tyrosine kinase receptor subtypes useful in assays to screen various compositions which modulate these receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Residues 592-647 of human fibroblast growth factor receptor 1 (FGFR1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                      Protein tyrosine kinase; PTK receptor; PTK receptor modulation assay.

Composition for the design or screening of a cytoplasmic Tie2 receptor tyrosine kinase domain modulator, comprises a monoclinic or orthorhombic crystalline form of a cytoplasmic Tie2 receptor tyrosine kinase domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               human Tiez receptor tyrosine kinase domain polypeptide in a monoclinic, receptor tyrosine kinase domain polypeptide in a monoclinic, receptor tyrosine kinase thought to be involved in vascular development. Naturally occuring R849% and R8978 mutations in the Tiez protein have been identified in human s and have been shown to segregate with the autosomal dominant condition vascular dysmorphogenesis. The invention also comprises methods for designing modulators of the biological activity of the cytoplasmic Tiez receptor tyrosine kinase domain. The Tiez receptor tyrosine kinase domain is used to design or screen for a modulator of the kinase by rational drug design, using computer models. The present sequence represents residues 592-647 of human fibroblast growth factor receptor 1 (FGFR1). The catalytic domain of FGFR1 closely resembles that of Tie 2 and they share 45 percent sequence identity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to the 3 dimensional crystal structure of the
               Tie2; Tie2K; human; crystal structure; vascular dysmorphogenesis; protein co-ordinate data; receptor tyrosine kinase; FGFR1; vascular development; fibroblast growth factor receptor.

Sequences ABP31028-ABP35561 represent 4534 novel human proteins designated ORF (open reading frame) 1-4534, and sequences ABN75054-C designated ORF (open reading frame) 1-4534, and sequences ABN75054-BBN75837 represent cDNAs encoding them. The invention also encompasses CC polypeptides at least 80% identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX ct the ORFX nucleic acid sequences, vectors and host cells comprising ORFX ct the ORFX nucleic acid sequences, vectors and host cells comprising ORFX copypeptides, the recombinant production of ORFX potential, antibodies of specific for ORFX proteins, antibodies of polypeptides, methods of screening individuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide cartivity, and methods of screening individuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide cargo of biological activities, such as cytokine, cell proteins and collisers and call proteins activity, hasmostatic activity, hasmostatic activity, hasmostatic activity, thrombolytic activity, receptor/ligand, antiinflammatory activity, thrombolytic activity, company and antiinfective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins of bodily characteristics, fertility and behaviour. ORFX proteins of the proliferative disorders such as epilepsy and Alzheimer's disorders active and antibodies may be used in the treatment of cancers, corgan transplantation, disorders of tissue growth and regeneration, disorders and processes caused by viral, bacterial, corgan transplantation, disorders such as epilepsy and Alzheimer's disorders and prodens. Of tissue growth and regeneration, corgan transplantation, disorders such as epilepsy and Alzheimer's disorders and probes, in the detection of ORFX genomic sequences in genetic diagnosis, and in forensic biology. The ORFX proteins, and in drug screening. The ORFX proteins an

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a cares. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. Pracnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies and downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as therefore treat P. acnes infections. The antibodies may also be used as

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

cucoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a comprision, antibodies against polypeptides of the invention; antibodies against polypeptide of the invention; and an isolated T cell population comprising T cells prepared to invention; and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising T cells prepared via this method; a vaccine composition (comprising T cells populations, or antigen-presenting cells that express the polypeptide; antibodies, fusion proteins, T cell populations, or carding the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a complete presenting cells that express the polypeptides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne polypeptides are useful for diagnosing, preventing or treating acne controlly protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the estimalistion of an immune response against process of the reading frame) contained within the P. acnes polymentic assay. The present candithe kit is useful for performing a diagnostic assay. The present canding frame) contained within the P. acnes polymentice date for this patent did not form part of invention. Note: The sequence data for this patent did not form part of invention. Note: The sequence data for this patent did not form part of free processions and the printed specification, but was obtained in electronic format directly free fromes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Maisonneuve JL;
Jones R, Carter D;
                                                                                                                                      Propionibacterium acnes predicted ORF-encoded polypeptide #2608.
                                                                                                                                                                                   Acne vulgaris; antiseborrhoeic; dermatological; antibacterial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Persing DH, Bhatia A,
Lodes MJ, Benson DR,

AAF92502 to AAF92572 represent nucleic acids which encode taste transduction G-protein coupled receptors designated T2R proteins.

AAB87731 to AAB8784 represent T2R proteins, and AAB87825 to AAB87830 represent T2R proteins, and AAB87825 to AAB87830 represent T2R family consensus sequences from the present invention. The T2R proteins are taste modulators. The nucleic acids are useful as probes for the identification of taste cells, as the nucleic acids are specifically expressed in taste cells. They also serve as tools for the generation of taste topographic maps that elucidate the relationship between the taste cells of the tongue and taste sensory neurons leading to taste centres in the brain. The taste modulators are useful for pharmacological and genetic modulation of taste signalling pathways. Modulatory compounds comprising T2R proteins can therefore be used in food and pharmacoulogical industries to customise taste, for e.g. to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding the T2R family of G-protein coupled taste receptors, useful for identifying taste modulators that can be used in food and pharmaceutical industries to customize taste, for e.g. to decrease the bitter taste of food.
                                                                                                                                                                                                                                                                               Human, rat, mouse, T2R, taste receptor, G-protein coupled receptor, taste transduction G-protein coupled receptor; identification, tongue, taste sensory neuron, taste cell; taste modulator, food, taste signalling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                79.3%; Score 23; DB 4; Length 90; 42.9%; Pred. The invention relates to a novel enterohaemorragic Bscherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 057:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enterohemorragic Escherichia coli O157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.
                                                                                                       Enterohaemorragic E. coli 0157:H7-specific protein SEQ ID NO: 1692
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hyperthermophile Methanopyrus kandleri protein #431.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hyperthermophile, protein stability enhancement;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention is related to a novel method of identifying a compound that modulates the activity of a TIR or T2R taste receptor. The method comprises providing a eukaryotic cell that expresses a functional TIR or T2R taste receptor and a G protein that couples to it, contacting the eukaryotic cell with a compound and identifying whether the compound modulates the activity of TIR or T2R expressed by the eukaryotic cell based on its effect on MARK activity, CAMP accumulation or adenylyl cyclase activity. The method is used to identify a compound that blocks or bitter taste associated with a particular T2R activator or that blocks or chances unami taste elicited by a compound that activates the TIRZ/TIR3 (umani) taste receptor or sweet taste elicited by a compound that activates the TIRZ/TIR3 (sweet) taste receptor. The method is useful in identifying a compound that modulates the activity of a TIR or T2R taste receptor. The present sequence is that of a human T2R taste receptor creceptor. The present sequence is that of a human T2R taste receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a compound that modulates the activity of a T1R or T2R taste receptor by assaying the effect of the putative modulatory compound on MAPK activation, cAMP accumulation or adenylyl cyclase activity in the
                                                                                                                                                                                                                                                                                   12R, taste receptor; G protein; modulatory compound; MAPK activity; accumulation; adenylyl cyclase; bitter; taste; umami; sweet; T2R22;

                                                                                                                                                                                                             hyperthermophile Methanopyrus kandleri, the invention also comprises the complete genome from Methanopyrus kandleri. The Methanopyrus kandleri proteins of the invention are useful for enhancing the stability and/or activity of other proteins. The Methanopyrus kandleri genome is useful in a variety of diagnostic and analytical methods. The present amino acid sequence represents a Methanopyrus kandleri protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to Enterococcus faecalis polynucleotides and bolypetides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for
                                                                                                New isolated nucleic acids encoding any of about 1700 Methanopyrus kandleri proteins, and the encoded proteins, useful as a medicaments or as diagnostic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid comprising a sequence encoding an Enterococcus fecalis polypeptide, useful for preparing a composition for diagnosing or treating E. fecalis infection.
                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention describes a novel protein conjugate (I) comprising at least 1 functional region (FR) at any position in the sequence of a carrier protein (II) to form a capsid three-dimensional structure of the Lumazine synthase (LS) type, such that the outer periphery is covalently invention also describes (I) a hetero-oligomeric protein conjugate (Ia) comprising either a mixture of at least 2 comprising either a mixture of at least 1 comprising either a mixture of at least 1 configuration of the components optionally covalently linked by chemical treatment; configuration of (I) or of at least 1 (I) that lacks FR, with the components optionally covalently linked by chemical treatment; configuration of (I); (4) a DNA (III) that encodes (I); (5) LS from preparation of (I); (4) a DNA (III) that encodes (I); (5) LS from Bacillus subtilis with Cys 33 and/or Cys139 replaced by Ser; (6) DNA (III) encoding LS from Aquifex aeolius which is codon-optimized for expression in a recombinant Escherichia coli strain; (7) a chimeric protein (CP) comprising amino acids (aa) 1-60 from LS of B. subtilis and can = 61-154 from LS of A. aeolius for use as (II); and (B) pharmaceutical compositions and vaccines containing (I) and (Ia). The products of the invention have cycostatic, antiviral and antibacterial activity and can be used in a vaccine or for gene therapy. (I) are used as pharmaceuticals
                                                                                                                                                                                                                                                                   ö
producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector comprising the nucleic acid and a call comprising the recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lumazine synthase; capsid; cytostatic; antiviral; antibacterial; vaccine; gene therapy; immunotherapy; biosensor; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein conjugate based on lumazine synthase as carrier, useful e.g. for vaccination and immunotherapy, contains many functional molecules attached to outside of the carrier.
                                                                                                                                                                                                                                                                     Gaps

ö
              tumors) and in vaccine, including multivalent vaccines, against bacterial or viral infections, to produce diagnostic or therapeutic antibodies, for selections, to produce diagnostic or therapeutic antibodies, and for preparation of protein libraries. (I) may also be used as blosensors and for diagnosis, e.g. of tumors. Genes that encode (I) are useful in DNA vaccines and for preparation of plant-based oral vaccines. (I) can contain many FR (same or different) at the surface of a spherical particle (LS comprises 60 subunits that assemble into an icosahedron). The large number of FR may increase sensitivity in immunoassays and the efficiency of immunotherapy agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Bscherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Bseudomonas aeruginosa and Enterococcus facalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify
 for immunotherapy of human immune deficiency virus infection or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequence (ABA90521) and related proteins (ABB53300-ABB5521). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactins or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at [ftp.wipo.int/pub/published_pot_sequences. (Updated on 29-AUG-2003 to standardise OS field)
              antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antiense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
 to express these proteins, and to obtain
                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleotide sequence useful in the identification or Lactococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present invention is related to a Lactococcus lactis nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Biosynthesis; biodegradation; lactic bacterium; yogurt; cheese.

GRNERAL INFORMATION:

APPLICANT: Keith Meinstock et al

APPLICANT: Keith Meinstock et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN

TITLE OF INVENTION: NUMBER: US/09/248,796A

CURRENT APPLICATION NUMBER: US 60/074,725

PRIOR PEPLION NUMBER: US 60/074,725

PRIOR PELING DATE: 1998-02-13

PRIOR PELING DATE: 1998-02-13

NUMBER OF SEQ ID NOS: 28208

SEQ ID NO 16636

LENGTH: 74

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 47506, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster
FILE REFERENCE: File Reference: 7326-094
CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 29

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: MOHAWMADI, MOOSA
APPLICANT: MCHARMADI, MCNSTALLS OF THE TYROSINE KINASE DOMAIN OF NON-INSULIN
TITLE OF INVENTION: RECEPTOR TYROSINE KINASES
TITLE OF INVENTION: RECEPTOR TYROSINE KINASES
TITLE OF INVENTION: RECEPTOR TYROSINE KINASES
CURRENT APPLICATION NUMBER: US/09/664,526
CURRENT APPLICATION NUMBER: 09/188,809
PRIOR FILING DATE: 1998-11-09
PRIOR FILING DATE: 1998-11-09
PRIOR FILING DATE: 1996-08-21
NUMBER OF SEQ ID NOS: 41
SOFTWARE: PATCHIN VEY: 2.1
SOFTWARE: PATCHIN VEY: 2.1
                    Patent NO. 6882921

Sequence 2, Application US/09664526
Patent No. 6668291
GENERAL INFORMATION:
APPLICANT: MOHAMMADI, MOCSA
APPLICANT: SCHLESSINGER, JOSEPH
APPLICANT: HUBBARD, STEVAN R.
TITLE OF INVENTION: RECEPTOR TYROSINE KINASE DOMAIN OF NON-INSULIN
TITLE OF INVENTION: RECEPTOR TYROSINE KINASES
FILE REPERENCE: 038602/0847
CURRENT APPLICATION NUMBER: US/09/664,526
CURRENT FILING DATE: 2000-09-18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

                                                                                                                                                                                                      Sequence 10, Application US/09664526;
Patent No. 6682921
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: MOHAMMADI, MOCSA
TITLE OF INVENTION: CRYSTALS OF THE TYROSINE KINASE DOMAIN OF NON-INSULIN
TITLE OF INVENTION: RECEPTOR TYROSINE KINASES
FILE REFERENCE: 038602/0847
CURRENT APPLICATION UNMBER: 09/188,809
FRIOR APPLICATION NUMBER: 09/188,809
FRIOR APPLICATION NUMBER: 09/188,809
FRIOR APPLICATION NUMBER: 09/189-11-09
FRIOR APPLICATION NUMBER: 08/701,191
FRIOR FILING DATE: 1996-08-21
NUMBER: O SEQ ID NOS: 41
SCOFTWARE: Patentin Ver. 2.1

Sequence 43247, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster;

FILE REPRENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT APPLICATION DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFUMARE: PatentIN Ver. 2.0

SEQ ID NO 43247

Sequence 7991, Application US/09328352

Patent No. 6562958

GENERAL INFORMATION:

APPLICANT: GAIT L. Breton et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER

TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: DATE: 1999-0.03PA

CURRENT APPLICATION NUMBER: US/09/328,352

CURRENT FILING DATE: 1999-06-04

NUMBER OF SEQ ID NOS: 8252

SEQ ID NO 7991

LENGTH: 613
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Sequence 10904, Application US/09949016

Sequence 10904, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

FILE REPERENCE: CLOOD1307

CURRENT APPLICATION NUMBER: US/99/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR PELING DATE: 2000-10-20

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-10-03

NUMBER OF SEQ ID NOS: 207012

SOFTWARE: FREAESEQ for Windows Version 4.0

SEQ ID NO 10904
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 816;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  79.3%; Score 23; DB 4; Length 816; 57.1%; Pred. Sequence 1, Application US/07640029

Patent No. 5229501

GENERAL INFORMATION:

APPLICANT: Kiefer, Michael C.

APPLICANT: Walenzuela, Pablo D.T.

APPLICANT: Barr, Philip J.

TITLE OF INVENTION: Expression and Use of Human Fibroblast

TITLE OF INVENTION: Growth Factor Receptor

NUMBER OP SQUENCES: 12

CORRESPONDENCE ADDRESS:

ADDRESSEE: Chiron Corporation
                                                                         ESSUL: 8-50-3

1S-09-383-630-3

1 Sequence 3, Application US/09383630A

2 Patent No. 6256532

2 GENERAL INFORMATION:

APPLICANT: ATNET YAYON et al.

TITLE OF INVENTION: ANIMAL MODEL FOR FIBROBLAST GROWTH

CHONDRODYSPLASIA
                                                                                                                                                                                                                                                                                  NUMBER OF SEQUENCES: 18
